

CEDAR: The Dispute That Evolves

AGENTIC AI-POWERED INVESTIGATION PLATFORM

A stateful AI dispute platform built for operations teams who know that disputes don't end on Day 1.

The Problem: Disputes Don't Stand Still

Evidence Arrives Late

New proof surfaces days or weeks after the initial claim is filed — long after your system has already locked in a decision.

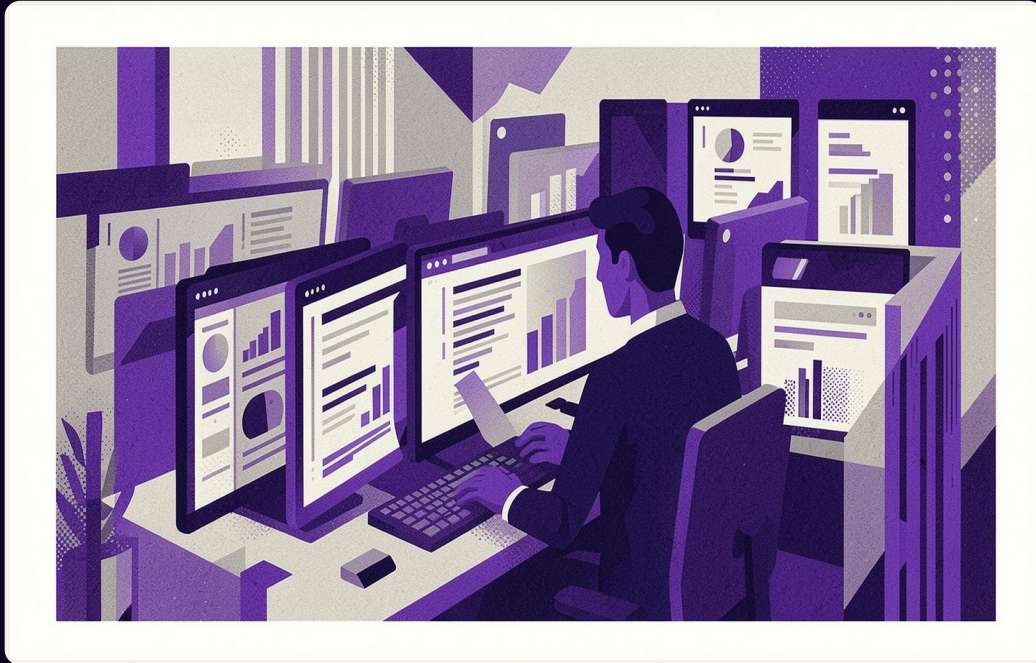

Systems Freeze at Day 1

Your current dispute platform captures a snapshot and stops. It has no way to update conclusions as facts evolve.

Wrong Decisions Stay Wrong

New proof contradicts old conclusions — but you have no way to know which decisions are now incorrect or how many are affected.

Why Banks Struggle Today

THE THREE FAILURE MODES

Evidence Scattered

Customer, merchant, bank, courier, and authentication data live in entirely separate systems. No one sees the full picture.

Decisions Made Blind

Analysts manually stitch fragments together — missing connections that a connected system would catch instantly.

No Single Truth

When facts change, there is no way to trace impact across prior decisions. Errors compound silently.

The CEDAR Difference: A Living Dispute State

Unlike static systems that freeze decisions, CEDAR maintains a continuously evolving view of every dispute.

One Unified View

All evidence, hypotheses, and decisions in a single, continuously updated state — not scattered across systems.

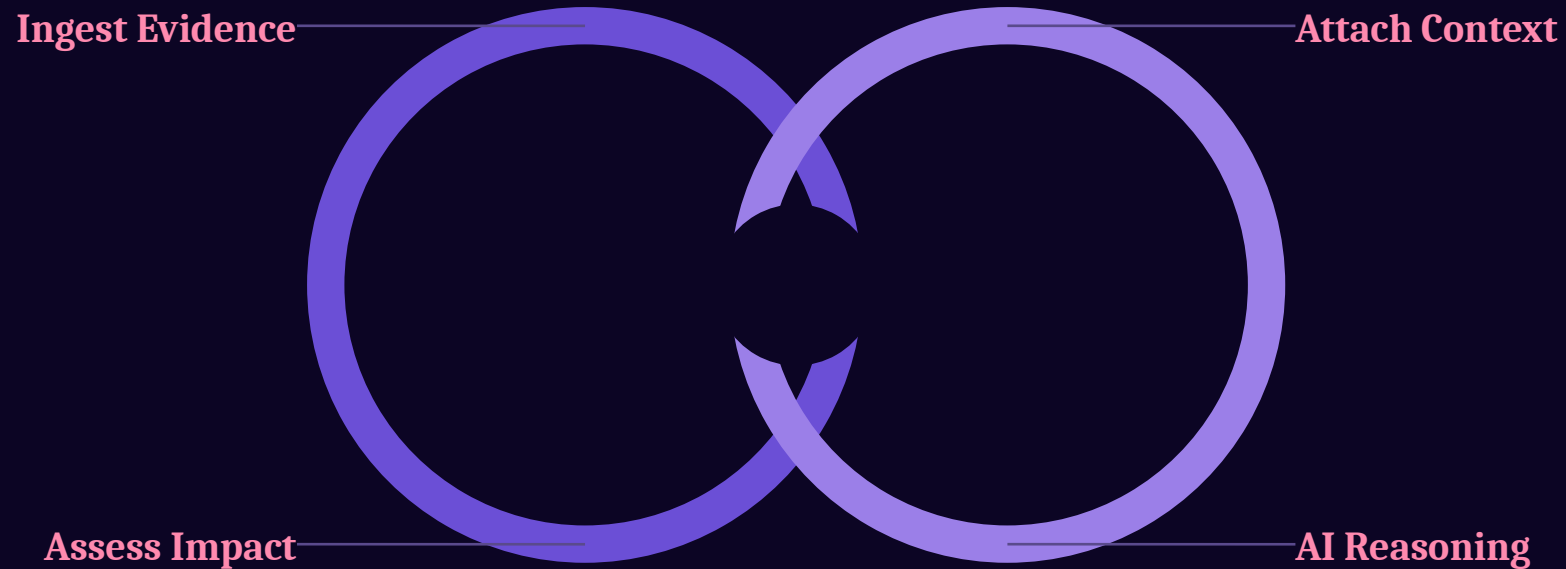

Automatic Impact Tracing

When new evidence arrives, CEDAR immediately traces which prior conclusions are affected — without manual effort.

Reassess, Don't Restart

Update affected conclusions from exactly where the new evidence enters. No need to rebuild the case from scratch.

How CEDAR Works: The Operating Loop

Every new piece of evidence travels the full loop — automatically, consistently, and with complete lineage at every step.

Real Example: Late Evidence Changes Everything

1

Day 1 — Claim Filed

Customer claims non-delivery. CEDAR sets initial hypothesis: 82% likely delivered. Decision logged with full reasoning.

2

Day 5 — New Evidence Arrives

GPS data, delivery signature scan, and photo confirmation are ingested. CEDAR automatically re-evaluates.

3

Day 5 — Hypothesis Shifts

Confidence flips to 62% non-delivery. CEDAR surfaces what changed, why it changed, and what action to take next.

Enterprise-Grade by Design

Stateful AI

Context persists across long-running investigations. CEDAR remembers everything — so your analysts don't have to.

Human in the Loop

AI recommends the next action. Your team makes the final call. Authority and accountability stay where they belong.

Complete Lineage

Every decision is traced, auditable, and explainable. Regulators and reviewers can follow every step with confidence.

Safe Execution

Policy, authority levels, and idempotent actions are built into every step — so no action is taken twice by accident.

The CEDAR Promise

A single, living source of truth for disputes — where every new event can be understood, traced, challenged, and safely incorporated into your decision.

Start with card disputes. Apply the same decision fabric to every transaction decision across your enterprise. CEDAR is not a point solution — it is the operating model for how disputes should work.

What You Get

- One unified dispute state — always current
- Automatic re-evaluation when facts change
- Full audit trail for every decision
- Human control at every critical step
- A foundation that scales beyond card disputes

Ready to Evolve Your Disputes?

See for yourself how CEDAR handles the cases your current system can't.

01

Live Reconstruction

See CEDAR reconstruct a real dispute — with late evidence, shifting hypotheses, and full lineage — in minutes.

02

Understand the Impact

Learn how stateful AI reduces manual analyst work, improves decision accuracy, and closes audit gaps.

03

Plan the Scale

Explore how to expand from card disputes to enterprise-wide transaction decisions using the same platform.
