

NEXUS CEDAR Platform

Agentic AI-Powered Investigation Platform for Intelligent, Automated & Compliant Transaction Disputes

END-TO-END VIEW: Claim Intake → Evidence → AI Intelligence → Decision → Human & Policy Review → Action → Outcome

CORE PRINCIPLE — AI recommends. Policy authorizes. Human is accountable. Software executes. Every change is visible.

Architecture

- **Channels & Stakeholders** — Customers, merchants, investigators, specialists, approvers, and auditors, each working through a role-specific workspace rather than one generic UI.
- **Core Pipeline** — The 7-stage agentic flow — Intake → Evidence → AI Intelligence → Decision → Human & Policy → Action → Outcome — with a mandatory human approval gate before any consequential action.
- **Continuous Reassessment Loop** — Detects late or new evidence, finds every decision that depended on it, re-runs only that reasoning, and produces a new, traceable decision version.
- **Platform Services** — Cross-cutting security, data protection, audit & timeline, AI guardrails, notifications, and monitoring shared by every other layer.
- **Data & Knowledge Layer** — Operational DB, evidence store, knowledge graph, search index, vector store, and cache — each purpose-built for a different access pattern.
- **Integration & Event Layer** — Event-streaming backbone (Kafka / Azure Event Hubs) plus connectors, webhooks, and idempotent, reconciled integration with external systems.
- **Platform & Operations Layer** — Containers, CI/CD, secrets, observability, compliance auditing, backup/DR, and cost management — what makes the platform operable, not just functional.
- **Design principle** — AI recommends. Policy authorizes. Human is accountable. Software executes. Every layer enforces that separation.
