

CEDAR

Prevent • Resolve • Recover

Understanding the Business Problem

Disputes Are Not Forms

Long-running, evidence-intensive decisions made under strict deadlines – not simple intake workflows.

Fragmented Evidence

Customer, merchant, and transaction data arrives asynchronously, making coherent case reconstruction difficult.

Reactive Operations

Teams manually reconstruct event histories after disputes have already escalated and become costly.

Leakage at Every Stage

Weak evidence packages, missed deadlines, and poor prioritization convert recoverable cases into write-offs.

Vision to Value: Prevent, Understand, Recover

01

Prevent

Clarify transactions and resolve avoidable issues before a case is ever created.

02

Collaborate

Exchange evidence with merchants before escalation to chargeback.

03

Understand

Reconstruct events, expose conflicts, and retain uncertainty with full provenance.

04

Recover

Prioritize recoverable work and strengthen evidence packages at the right moment.

05

Govern

Keep policy, approvals, and liability decisions firmly under human control.

Business Value with CEDAR

Dispute Prevention 30%

Human Touch point Reduced by 42%

Efficiency Gain

Straight Through Processing

Average Cost of Handling a dispute reduced to 11\$

Business Value: Five Integrated Capabilities

Guided Intake

Transaction enrichment, merchant recognition, and refund visibility at the point of claim.

Evidence Intelligence

Immutable evidence with provenance, timeline reconstruction, contradiction detection, and gap exposure.

Merchant Collaboration

Portal and API-based evidence exchange enabling pre-chargeback resolution with merchants.

Recovery Optimization

Probability scoring surfaces the cases most likely to recover, with clear write-off recommendations.

Human Control

Policy enforcement, maker-checker workflows, idempotent actions, and complete audit trails.

Solution Architecture: Composable Platform

Designed for Enterprise Trust

CEDAR's layered architecture separates concerns deliberately — deterministic services enforce business rules while bounded AI agents augment investigator judgment without replacing it.

- **23 specialized AI agents** scoped to intake, reasoning, work assistance, and prevention
- **No autonomous decisions** — every consequential action requires human approval
- **Policy-as-code** ensures auditability and regulatory defensibility
- **Kafka + knowledge graph** power real-time evidence correlation across case histories

What's Next: Five-Day Event & Future Phases

1

This Week

Proof of concept: guided intake, evidence intelligence, and human control working end-to-end.

2

Phase 2

Merchant collaboration portal and pre-chargeback resolution capabilities.

3

Phase 3

Advanced recovery optimization, write-off recommendations, and recovery probability scoring.

4

Phase 4

Domain expansion into claims, payments, and wallet use cases.

📄 Detailed technical, functional, and business diagrams are available in the Appendix for drill-down questions.

APPENDIX

CEDAR Technical & Business Deep-Dives

The following slides provide detailed architectural, functional, and process diagrams for technical audiences and drill-down discussion during the five-day event.

Existing vs. Semi-Automated Dispute Process

DISPUTE INTELLIGENCE FABRIC 2.0

Existing Manual / Semi-Automated Dispute Process

Current-state swim lanes with transformation overlay showing what is AI-assisted, automated, retained for humans, or reduced/removed

	AI-ASSISTED	AUTOMATED / CONTROLLED	HUMAN DECISION RETAINED	MANUAL STEP REDUCED / REMOVED	Overlay meaning: colored bars describe the target-state treatment of each current activity.	
SWIM LANE	1. Initiate & Clarify	2. Create Case	3. Gather Evidence	4. Investigate	5. Decide & Approve	6. Execute & Close
Customer / Channel	Reports issue; may not recognize merchant, refund or delivery status AI-ASSISTED	Repeats transaction details and dispute reason REDUCE / REMOVE	Uploads statements, receipts or screenshots when requested AI-ASSISTED	Responds to follow-up questions across channels REDUCE / REMOVE	Receives outcome; limited visibility into rationale AI-ASSISTED	Tracks status and may contact bank again AI-ASSISTED
Contact Centre / Service	Manually clarifies merchant, pending transaction, refund or delivery AI-ASSISTED	Keys case details; selects reason code; duplicate risk REDUCE / REMOVE	Requests evidence using standard templates AI-ASSISTED	Chases customer / operations for missing information REDUCE / REMOVE	Explains recommendation or requests more information HUMAN RETAINED	Sends status and closure communication AUTOMATED / CONTROLLED
Dispute Operations	Receives formal case, often after limited pre-checks AI-ASSISTED	Validates data across multiple screens and systems REDUCE / REMOVE	Searches fragmented systems; downloads and stores documents REDUCE / REMOVE	Manually reconstructs timeline; compares narratives; checks rules AI-ASSISTED	Prepares recommendation and case pack AI-ASSISTED	Updates case, monitors deadlines, handles rework AUTOMATED / CONTROLLED
Maker / Checker / Approver	Limited involvement at intake HUMAN RETAINED	Reviews exceptions or high-risk routing HUMAN RETAINED	Checks evidence completeness when required AI-ASSISTED	Reviews investigator analysis and unresolved uncertainty HUMAN RETAINED	Authorized human decides liability / action and records rationale HUMAN RETAINED	Approves consequential action; handles exceptions HUMAN RETAINED
Merchant / Acquirer / Network	Usually engaged only after formal case creation AI-ASSISTED	Receives case or evidence request through available channel AUTOMATED / CONTROLLED	Provides order, delivery, refund, authentication or correspondence evidence AUTOMATED / CONTROLLED	Responds to follow-up; evidence may arrive late or conflict AI-ASSISTED	Network / scheme process applies where required HUMAN RETAINED	Executes chargeback, representment or other formal lifecycle step AUTOMATED / CONTROLLED
Systems & Data	Basic channel validation; limited unified context AI-ASSISTED	Case system creates record; workflow mainly static AUTOMATED / CONTROLLED	Data remains siloed; attachments copied; lineage weak REDUCE / REMOVE	Rules and spreadsheets assist, but contradictions remain hidden AI-ASSISTED	Decision and approval recorded across systems AUTOMATED / CONTROLLED	Reconciliation, audit and closure are fragmented AUTOMATED / CONTROLLED

Target-state intent: remove repetitive evidence hunting and re-keying; use AI for evidence understanding and recommendations; retain authorized humans for consequential decisions; execute only through controlled services.

Evidence → Intelligence → Human Decision → Controlled Execution 1

CEDAR: Prevention to Recovery Journey
