

CUSTOMERS

- Guided dispute intake
- Real-time status & transparency
- Faster resolution
- Fair outcomes

MERCHANTS

- Reduced chargebacks & losses
- Automated evidence collection
- Faster representment & recovery
- Enhanced customer trust

ISSUERS

- Lower write-offs & higher recovery
- Reduced network dependency
- Operational efficiency
- Proprietary dispute intelligence

BUSINESS OUTCOMES

↓ 20-40%
Chargeback Avoidance

↓ 25-35%
Write-off Reduction

↑ 15-30%
Recovery Improvement

↓ 30-50%
Dispute Resolution Time

↑ 25-40%
Operational Efficiency

DISPUTE PREVENTION FIRST

DISPUTE INTELLIGENCE FABRIC 2.0

Prevent • Resolve • Recover

Evidence-backed AI, human-owned decisions, lower losses and better experiences for every participant.

Our understanding of the business problem

Disputes are not forms to process. They are long-running, evidence-intensive decisions under deadlines.

Fragmented evidence

Customer, merchant, transaction, delivery, authentication and network records arrive at different times.

Reactive operations

Teams reconstruct the story manually after a dispute is already costly.

Leakage and write-offs

Weak evidence, missed deadlines and poor prioritization turn recoverable cases into losses.

Poor experience

Customers repeat information, merchants assemble evidence manually, issuers face long cycle times.

The structural issue

The current model optimizes the dispute lifecycle after it starts. The opportunity is to prevent avoidable disputes, collaborate earlier and make every genuine case evidence-ready.

The ambition: move from “process a dispute” to “prevent, understand and recover”

North star: Evidence → Intelligence → Human Decision → Controlled Execution

Solution in one view

Five capabilities work as one prevention-to-recovery fabric.

1

Guided intake

Transaction enrichment,
merchant recognition,
refund and delivery
visibility.

2

Evidence intelligence

Immutable evidence,
provenance, timeline,
contradictions, gaps and
hypotheses.

3

Merchant collaboration

Portal/API evidence
exchange and pre-
chargeback resolution.

4

Recovery optimization

Recovery probability, next-
best evidence/action and
write-off recommendations.

5

Human control

Policy, maker-checker,
idempotent actions, audit
and point-in-time replay.

Future-state journey: intervene earlier, decide better

Genuine cases continue; avoidable issues are resolved before formal dispute creation.

Why this is differentiated

Not another case-management front end, and not autonomous adjudication.

Prevention before processing

Transaction clarification and guided resolution are first-class capabilities.

Evidence graph, not document pile

Assertions, provenance, dependencies and bitemporal timelines make reasoning traceable.

Targeted re-evaluation

Late evidence invalidates only affected outputs, recommendations and approvals.

Institution-owned intelligence

Networks are used for execution and interoperability, not outsourced investigation.

Human-centered AI controls

Agents classify, compare, rank and draft; rules and people own consequential outcomes.

Domain-agnostic evidence core

Common intelligence patterns extend beyond cards to other payment and claims domains.

End-to-end solution architecture

A composable platform with bounded AI, deterministic controls and scheme-agnostic connectors.

Read top to bottom: stakeholder experiences → intake and case services → AI intelligence → data and integration → secure operations

Layers 1–3: experience, business services and policy control

1. Omnichannel experience

Customer self-service and guided intake

Merchant portal for collaboration

Investigator, specialist and approver workspaces

Operations, audit and governance dashboards

2. Case & workflow services

Case lifecycle and tasks

Evidence and communication services

Approvals and controlled actions

Deadlines, retries and long waits

API-first experience composition

3. Deterministic decision services

Eligibility and duplicate rules

Scheme, market and jurisdiction policy

Authority and maker-checker controls

Idempotent action gateway

Human-liability record

Layer 4: bounded AI and agent orchestration

Agents are specialized workers around a governed case state, not autonomous judges.

A01–A07

Intake & evidence

Structure, classify, extract, validate provenance, resolve entities, detect duplicates and assess quality.

A08–A12

Reasoning

Reconstruct events, detect contradictions, identify gaps, maintain hypotheses and assess material change.

A13–A17

Work assistance

Recommend evidence/actions, prepare reviewer packs, draft correspondence and monitor AI assurance.

A18–A23

Prevention & recovery

Flag clarification needs, prevent avoidable disputes, score recoverability, collaborate with merchants, optimize write-offs and guide customers.

Hard boundary: no agent rejects a genuine case, declares fraud, decides liability or executes a consequential external action.

Layers 5–7: data, integration and secure operations

NFR focus: scalability, resilience and performance

Scale the hot path independently while keeping expensive reasoning asynchronous.

Elastic services

Stateless APIs and independently scalable workers.

Partitioned events

Case-keyed streams preserve order while scaling throughput.

Async heavy work

OCR, extraction and agent reasoning are off the interactive path.

Durable recovery

Retries, idempotency, status inquiry and reconciliation.

Selective refresh

Material change re-runs only impacted analysis.

Degraded modes

Human-only and rules-only operations when models or tools are unavailable.

NFR focus: cost efficiency and speed

Costs fall when we prevent work, automate evidence and spend intelligence only where value exists.

Prevent work

Clarify descriptors, refunds and delivery status before cases are created.

Reduce manual touches

Auto-classify, extract, reconcile and assemble reviewer-ready packs.

Use bounded models

Shorter context, model routing, caching and human-only fallback control AI spend.

Prioritize recoverability

Focus specialist effort on cases with useful evidence and viable deadlines.

Avoid duplicate actions

Idempotency and reconciliation prevent repeated postings and scheme submissions.

Accelerate decisions

Parallel analysis and proactive evidence requests reduce waiting and rework.

Measure against a baseline: cost per case • AI cost per resolved case • manual touches • avoided disputes • recovery value • cycle time

Domain-agnostic by design

The intelligence core is common; policies, evidence types and execution rails are configurable.

One platform, aligned value for every stakeholder

Customer

Clearer transactions, fewer accidental disputes, faster genuine-case resolution and transparent status.

Merchant

Lower chargeback leakage, automated evidence, faster response and better revenue protection.

Issuer

Lower write-offs, stronger recovery, lower operational cost and institution-owned intelligence.

Operations & control

Prioritized work, fewer missed deadlines, clear approvals, audit replay and safer AI controls.

Value alignment reduces friction: better context for the customer, less evidence effort for the merchant and stronger control for the issuer.

Pragmatic adoption roadmap

Prove value without forcing a full POS or network transformation on day one.

Our proposal

Turn disputes into institution-owned intelligence

Prevent what should not become a case.
Resolve genuine cases with stronger evidence.
Recover value before write-off.
Keep humans in control.

Thank you • Questions

Why this deserves to win

- ✓ Business outcome-led, not AI-led
- ✓ Architecturally feasible and incrementally adoptable
- ✓ Differentiated by prevention + evidence graph + recovery
- ✓ Scalable, domain-agnostic and cost-aware
- ✓ Human-owned, auditable and regulator-ready
